The indoor environment affects occupants' health and comfort. Poor environmental conditions and indoor contaminants are estimated to cost the U.S. economy tens of billions of dollars a year in exacerbation of illnesses like asthma, allergic symptoms, and subsequent lost productivity. Climate change has the potential to affect the indoor environment because conditions inside buildings are influenced by conditions outside them. *Climate Change, the Indoor Environment, and Health* addresses the impacts that climate change may have on the indoor environment and the resulting health effects. It finds that steps taken to mitigate climate change may cause or exacerbate harmful indoor environmental conditions. The book discusses the role the Environmental Protection Agency (EPA) should take in informing the public, health professionals, and those in the building industry about potential risks and what can be done to address them. The study also recommends that building codes account for climate change projections; that federal agencies join to develop or refine protocols and testing standards for evaluating emissions from materials,

furnishings, and appliances used in buildings; and that building weatherization efforts include consideration of health effects. *Climate Change, the Indoor Environment, and Health* is written primarily for the EPA and other federal agencies, organizations, and researchers with interests in public health; the environment; building design, construction, and operation; and climate issues. A radically new understanding of and practical approach to climate change by noted environmentalist Paul Hawken, creator of the New York Times bestseller *Drawdown* *Regeneration* offers a visionary new approach to climate change, one that weaves justice, climate, biodiversity, equity, and human dignity into a seamless tapestry of action, policy, and transformation that can end the climate crisis in one generation. It is the first book to describe and define the burgeoning regeneration movement spreading rapidly throughout the world. *Regeneration* describes how an inclusive movement can engage the majority of humanity to save the world from the threat of global warming, with climate solutions that directly serve our children, the poor, and the excluded. This means we must address current human needs, not future existential threats, real as they are, with initiatives that include but go well beyond solar, electric vehicles, and tree planting to include such solutions as the fifteen-minute city, bioregions, azolla fern, food localization, fire ecology, decommodification, forests as farms, and the number one solution for the world: electrifying everything. Paul Hawken and the nonprofit *Regeneration Organization* are launching a series of initiatives to accompany the book, including a streaming video series, curriculum, podcasts, teaching videos, and climate action software. *Regeneration* is the inspiring and necessary guide to inform the rapidly spreading climate movement. An inspirational story of pioneering environmentalists who heightened awareness regarding nature's value and heroes of today who are working to secure a sustainable future. *Issues of the Day* provides an easy way for students, academics, journalists, policymakers, and the public to learn about a diverse range of policy issues affecting the environment, energy, transportation, and public health. Each commentary gives a short assessment of a topic, summarizing in a non-technical way the current state of analysis or evidence on the issue, along with selected recommendations for further reading. The essays are written by world renowned scholars, mostly economists, and provide useful insights on policy problems that are often complex and poorly understood. Some of the topics covered include air pollution, hazardous waste, voluntary environmental programs, domestic (U.S.) and global climate policy design, fishery management, water quality, endangered species, forest fires, oil security, solar power, road and airport, fuel taxes and fuel economy standards, alternative fuel vehicles, health and longevity, smoking, malaria, tuberculosis, and the environment and development. The objective is to disseminate the findings of sound, objective

research on the costs, benefits, and appropriate reform of public policies. The book provides a useful supplement for undergraduate- and graduate-level course reading, a reference guide for professionals, and a way for the general reader to quickly develop an informed perspective on the most important policy problems of the day. *Issues of the Day* is available to download as a PDF from the Resources for the Future website: www.rff.org/weeklycommentary An urgent and timely story of the contentious politics of incorporating environmental justice into global climate change policy Although the science of climate change is clear, policy decisions about how to respond to its effects remain contentious. Even when such decisions claim to be guided by objective knowledge, they are made and implemented through political institutions and relationships—and all the competing interests and power struggles that this implies. Michael Méndez tells a timely story of people, place, and power in the context of climate change and inequality. He explores the perspectives and influence low-income people of color bring to their advocacy work on climate change. In California, activist groups have galvanized behind issues such as air pollution, poverty alleviation, and green jobs to advance equitable climate solutions at the local, state, and global levels. Arguing that environmental protection and improving public health are inextricably linked, Méndez contends that we must incorporate local knowledge, culture, and history into policymaking to fully address the global complexities of climate change and the real threats facing our local communities. In this new study of energy use and global climate change, Richard Wolfson outlines basic science concepts as well as specific, contemporary applications in energy production and their environmental consequences. *Energy, Environment, and Climate* is structured on the premise that climate change is the dominant energy-related environmental issue of the twenty-first century. Traditional concerns like pollution and conservation of energy resources are covered with clear, scientific explanations. Unique to this text, a full five chapters—about one-third of the content—are devoted to climate and an understanding of the energy/climate link. Included are over 250 photographs and illustrations In recent decades there has been a growing awareness of how intricate the interactions are between human beings and the environment. Fortunately, progress has been made in understanding this relationship, and new technologies have been effective in addressing environmental problems. However belatedly, there has been an acknowledgment of the incompatibility of the world's finite resources with humankind's increasingly greater needs for them, and of how such a challenge demands broadened collaboration among engineers, social scientists, politicians and financial powers. Global agreement that the essential issues of the twenty-first century cannot be solved by any one discipline has led to the concept of sustainability.

The transdisciplinary contributions selected for inclusion in this book address these concerns with an overview of the diverse fields of study related to sustainability. This collection of work is intended to pave the way for further collaboration among scientists and nations as well. Chapter "Economy and Environment: How to Get What We Want" is available open access under a Creative Commons Attribution-NonCommercial-NoDerivatives 4.0 International License via link.springer.com. Climate change is not only one of the greatest threats to modern civilization; it is also a great challenge to economic development in the 21st century. Global warming can lead to periods of both drought and intense rain, causing crops to fail and ruining the livelihoods of many in underdeveloped countries. The Handbook of Research on Climate Change Impact on Health and Environmental Sustainability is an authoritative reference source that offers a comprehensive and timely analysis of various aspects of global warming and its consequences. Featuring such topics as assessment of and adaptation to climate change, water and its socio-economic impact, the environmental effects of climate change on human health, and the mitigation of climate change on both a local and global level, this expansive handbook is an essential reference source for students, researchers, academicians, engineers, government executives, and other practitioners looking to make a difference in the treatment of our environment. This publication features timely research on subjects including, but not limited to, climate change and its effect on both urbanization and the trade competitiveness of different regions, water-related diseases flourishing due to climate change, health risks and rethinking health service provision, losses from natural disasters, farmers' views on the environment, drought management policies, groundwater resource management, trends in long-term rainfall, fishery management and productivity, preserving biodiversity, and sustainable forest use. This book comes at a time when the world is confronted by one of the greatest challenges--the problem of environmental degradation. A collection of articles by renowned economists, scientists, and environmentalists, this book shows that while the state of the environment is intricately linked to economic development, the matter is in fact far more complex. One of the best-known connections is the Environmental Kuznet's Curve hypothesis, the limitations of which, both empirically and theoretically, are dealt with in the early part of the book. This is followed by a discussion on the shortcomings of the Kyoto Protocol and the particular problem of green house gasses. The other issues covered are: the negative contribution of environmental pollution; trade liberalization and its impact on the environment of developing countries, both in the short- and long term; alternative energy sources. The Handbook of Global Climate and Environment Policy presents an authoritative and comprehensive overview of global policy on climate and the environment. It combines the strengths of an interdisciplinary team of experts from around the world to explore current debates and the latest thinking in the search for global environmental solutions. Explores the environmental challenges we currently face, and the concepts and approaches to solving these Questions the role of global

actors, institutions and processes, and considers the links between global climate and environment policy, and that of the global economy Highlights the connections between social science research and global policy Brings together authoritative coverage of recent research by internationally-renowned experts from around the world, including from North America, Europe, and Asia Provides an essential resource guide for students and researchers from across a wide range of related disciplines - from politics and international relations, to environmental sciences and sociology - and for global policy practitioners Responding to climate change has become an industry. Governments, corporations, activist groups and others now devote billions of dollars to mitigation and adaptation, and their efforts represent one of the most significant policy measures ever dedicated to a global challenge. Despite its laudatory intent, the response industry, or 'Climate Inc.', is failing. Reimagining Climate Change questions established categories, routines, and practices that presently constitute accepted solutions to tackling climate change and offers alternative routes forward. It does so by unleashing the political imagination. The chapters grasp the larger arc of collective experience, interpret its meaning for the choices we face, and creatively visualize alternative trajectories that can help us cognitively and emotionally enter into alternative climate futures. They probe the meaning and effectiveness of climate protection 'from below'—forms of community and practice that are emerging in various locales around the world and that hold promise for greater collective resonance. They also question climate protection "from above" in the form of industrial and modernist orientations and examine large-scale agribusinesses, as well as criticize the concept of resilience as it is presently being promoted as a response to climate change. This book will be of great interest to students and scholars of climate change, global environmental politics, and environmental studies in general, as well as climate change activists. A provocative history of the environmental movement in America, showing how this rise to political and social prominence produced a culture of alarmism that has often distorted the facts Few issues today excite more passion or alarm than the specter of climate change. In A Climate of Crisis, historian Patrick Allitt shows that our present climate of crisis is far from exceptional. Indeed, the environmental debates of the last half century are defined by exaggeration and fearmongering from all sides, often at the expense of the facts. In a real sense, Allitt shows us, collective anxiety about widespread environmental danger began with the atomic bomb. As postwar suburbanization transformed the American landscape, more research and better tools for measurement began to reveal the consequences of economic success. A climate of anxiety became a climate of alarm, often at odds with reality. The sixties generation transformed environmentalism from a set of special interests into a mass movement. By the first Earth Day in 1970, journalists and politicians alike were urging major initiatives to remedy environmental harm. In fact, the work of the new Environmental Protection Agency and a series of clean air and water acts from a responsive Congress inaugurated a largely successful cleanup. Political polarization around environmental questions after

1980 had consequences that we still feel today. Since then, the general polarization of American politics has mirrored that of environmental politics, as pro-environmentalists and their critics attribute to one another the worst possible motives. Environmentalists see their critics as greedy special interest groups that show no conscience as they plunder the earth while skeptics see their adversaries as enemies of economic growth whose plans stifle initiative under an avalanche of bureaucratic regulation. There may be a germ of truth in both views, but more than a germ of falsehood too. America's worst environmental problems have proven to be manageable; the regulations and cleanups of the last sixty years have often worked, and science and technology have continued to improve industrial efficiency. Our present situation is serious, argues Allitt, but it is far from hopeless. Sweeping and provocative, A Climate of Crisis challenges our basic assumptions about the environment, no matter where we fall along the spectrum—reminding us that the answers to our most pressing questions are sometimes found in understanding the past. John Vogler examines the international politics of climate change, with a focus on the United Nations Framework Convention (UNFCCC). He considers how the international system treats the problem of climate change, analysing the ways in which this has been defined by the international community and the interests and alignments of state governments. An engaging exploration of energy's impact The public rely upon media representations to help interpret and make sense of the many complexities relating to climate science and governance. Media representations of climate issues - from news to entertainment - are powerful and important links between people's everyday realities and experiences, and the ways in which they are discussed by scientists, policymakers and public actors. A dynamic mix of influences - from internal workings of mass media such as journalistic norms, to external political, economic, cultural and social factors - shape what becomes a climate 'story'. Providing a bridge between academic considerations and real world developments, this book helps students, academic researchers and interested members of the public make sense of media reporting on climate change as it explores 'who speaks for climate' and what effects this may have on the spectrum of possible responses to contemporary climate challenges. The multi-disciplinary perspective provided here offers a strategic view on built environment issues and improve understanding of how built environment activities potentially induce global warming and climate change. It also highlights solutions to these challenges. Solutions to Climate change Challenges in the Built Environment helps develop an appreciation of the diverse themes of the climate change debate across the built environment continuum. A wide perspective is provided through contributions from physical, environmental, social, economic and political scientists. This strategic view on built environment issues will be useful to researchers as well as policy experts and construction practitioners wanting a holistic view. This book clarifies complex issues around climate change and follows five main themes: climate change experiences; urban landscape development; urban management issues; measurement of impact; and the future. Chapters are written by eminent specialists from both academic and professional backgrounds. The main context for chapters is the developed world but the discussion is widened to incorporate regional issues. The book will be valuable to researchers and students in all the built environment disciplines, as well as to practitioners involved with the design, construction and maintenance of buildings, and government organisations developing and implementing climate change policy. This book sets the questions of energy and the environment in the North in the global context and further addresses historical developments, views on energy taxation and tariffs, and effects of EU energy policy. Climate change appears more frequently than ever on the top of global and national policy agendas. In the current situation traditional environmental concern and environmental policy may not suffice in the face of the global challenge as manifested by climate change and the depletion of fossil energy resources. But as new data comes to light, new energy policies and changes in economic structures are crucial for putting into action global climate policy. Crucial tasks in environmental policy are the sustainable utilisation of natural resources and the conservation of natural and human-made habitats. One of the areas of the world where this comes into play the most is in the Nordic countries. Northern societies are predominantly high tech, high consumption and high energy supply societies. And with the transition from older energy sources (wood for heating and stream water for power production) to newer ones (oil and nuclear energy) discussions on the environmental impact have led to public and corporate action. The Northern countries have been at the forefront in finding sustainable alternatives to solve conflicts arising from the rise in energy needs. However, these countries have taken different pathways with different policies in attempting to achieve this. As the needs and concerns from climate change arise, a Northern dimension, involving policies that contrast to European and global trends, emerges. Energy, Policy, and the Environment: Modeling Sustainable Development for the North explores that dimension. Climate change is an issue that has been generating a significant amount of discussion, research, and debate in

recent years. Climate change continues to evolve at a rapid rate and continues to have a wide array of effects on everything from temperature to plant life. Beyond the negative environmental impacts, climate change is also proving to be a detriment to society with increasingly violent natural disasters and human health effects. It is essential to stay up to date on the latest in emerging research within this field as it continues to develop. The Research Anthology on Environmental and Societal Impacts of Climate Change discusses the varied effects of climate change throughout all areas of life and provides a comprehensive dive into the latest research on key elements of society that are affected by the rapidly increasing climate. Covering a range of topics including reproduction, plants and animals, and energy demand, it is ideal for environmentalists, policymakers, environmental engineers, scientists, disaster and crisis management personnel, professionals, government officials, practitioners, upper-level students, and academics interested in emerging research on the numerous impacts of climate change. 'In the past two decades there has been considerable work on global climatic change and its effect on the ecosphere, as well as on local and global environmental changes triggered by human activities. From the tropics to the Arctic, peatlands have developed under various geological conditions, and they provide good records of global and local changes since the Late Pleistocene. The objectives of the book are to analyze topics such as geological evolution of major peatlands basins; peatlands as self-sustaining ecosystems; chemical environment of peatlands: water and peat chemistry; peatlands as archives of environmental changes; influence of peatlands on atmosphere: circular complex interactions; remote sensing studies of peatlands; peatlands as a resource; peatlands degradation, restoration, plus more.' * Presents an interdisciplinary approach, with an emphasis on Earth Science, and addresses the need for integration between subdisciplines and the developing of new approaches * Synthesizes the evolutionary, ecological, and chemical characteristics of major peatlands, as well as focuses on the environmental changes, from climate changes to surface area changes due to human activities * Covers topical studies of worldwide interest and provides examples from many different countries Part I of this report is a synthesis that highlights eight selected themes, each of which relates to diagnoses, recommendations, and important lines of debate or inquiry. Part II describes the diagnoses and 39 recommendations from the eight working groups. This book presents the latest science and social science research on whether the world can adapt to climate change. The purpose of this textbook is to provide a well-rounded working knowledge of both climate change and environmental sustainability for a wide range of students. Students will learn core concepts and methods to analyze energy and environmental impacts; will understand what is changing the earth's climate, and what that means for life on earth now and in the future. They will also have a firm understanding of what energy is and how it can be used. This text intends to develop working knowledge of these topics, with both technical and social implications. Students will find in one volume the

integration and careful treatment of climate, energy, and sustainability. Energy, Environment, and Climate, Second Edition, is the most contemporary book for the energy course. Written for non-science majors, the text presents the physical concepts in easy-to-understand language and asks students to apply those concepts to contemporary energy issues. Students learn to analyze the important questions that face today's citizens and deal with the answers both qualitatively and quantitatively. End-of-chapter questions provide an opportunity for students to practice what they've learned and provide instructors with questions that can be debated in class. The acceleration of global climate change creates a nexus for the examination of power, political rhetoric, science communication, and sustainable development. This book takes an international view of twenty-first century environmental communication to critically explore mediated expressions of climate change. Individuals, international organizations and states are calling for the world to confront climate change. Efforts such as the Kyoto Protocol have produced intractable disputes and are deemed inadequate. This volume adopts two constructivist perspectives - norm-centred and discourse - to explore the social construction of climate change from a broad, theoretical level to particular cases. The contributors contend that climate change must be understood from the context of social settings, and that we ignore at our peril how power and knowledge structures are generated. They offer a greater understanding of why current efforts to mitigate climate change have failed and provide academics and policy makers with a new understanding of this important topic. Climate change has a significant and direct impact on human migration. This atlas provides a comprehensive and illustrated account of environmental migration worldwide, supported by expert analysis and presented in an accessible and informative way. The Atlas of Environmental Migration is the first and only illustrated book that maps environmental migration, clarifies terminology and concepts, draws a typology of migration related to environmental and climate change, describes the multiple factors at play, explains the challenges, and highlights the opportunities related to this phenomenon. Features include: Original maps illustrating the complex patterns and dynamics of environmental migration throughout the world Case studies and detailed analysis of countries and regions experiencing migration flows, forced or voluntary, related to sudden disasters and slow-onset environmental processes Coverage of fundamental considerations, such as: climate change adaptation; development; conflict; gender; human rights; legal protection; funding; and governance. The issue of environmental migration is gaining increasing attention on the international policy agenda, as it is at the heart of such issues as adaptation to climate change, economic and social development, livelihood sustainability and security, environmental and climate change governance and justice. Climatic change, now more than ever in this age of global warming, is seen as fundamental to the study of the environment. This text examines the importance of climate as one of the major forcing functions in the global environmental change process. It emphasizes both human-induced climatic change and

natural climatic change, providing a comprehensive historical context and important projections for the future. It offers a thorough, up-to-date, critical overview of the physical science behind global warming concerns. An environmental journalist reveals how some California military bases are leading the charge in the fight against climate change. In California, the US military has begun to redefine how our national security operations relate to the destabilizing effects of climate change. Several bases have taken on a largely unrecognized yet crucial role in renewable-energy innovation and in preserving cultural and natural treasures. These facilities are going beyond environmental stewardship to align national defense with energy security and the protection of endangered species. In *Unlikely Ally*, environmental journalist Marilyn Berlin Snell takes readers through these bases to examine what twenty-first-century sustainable-energy infrastructure looks like; whether combat readiness and species protection can successfully coexist; how cutting-edge technology and water-conservation practices could transform life in a resource-constrained world; and how the Department of Defense's scientific research into the metabolic secrets of the endangered desert tortoise could speed human travel to Mars. This volume offers a comprehensive overview of advanced research in the field of environmental green chemistry for air, soil and water pollutants, and presents emerging technologies on the chemical treatment of polluted sites and wastes. The 15 chapters, prepared by internationally respected experts, address the following topics: (1) monitoring of indoor and outdoor air pollutants; (2) atmospheric degradation processes and formation mechanisms of secondary pollutants; (3) the environmental assessment and impacts of soils polluted by heavy metals and hydrocarbons; (4) sustainable and emerging technologies for the chemical treatment of organic and animal wastes and wastewaters; (5) photocatalytic CO₂ conversion methods for the mitigation of greenhouse effects; and (6) non-conventional methods in green chemistry synthesis. Lastly, the authors outline the future perspectives of each topic. Given its multidisciplinary approach, combining environmental analysis and engineering, the book offers a valuable resource for all researchers and students interested in environmental chemistry and engineering. *Earth at Risk in the 21st Century* offers critical interdisciplinary reflections on peace, security, gender relations, migration and the environment, all of which are threatened by climate change, with women and children affected most. Deep-rooted gender discrimination is also a result of the destructive exploitation of natural resources and the pollution of soils, water, biota and air. In the Anthropocene, the management of human society and global resources has become unsustainable and has created multiple conflicts by increasing survival threats primarily for poor people in the

Global South. Alternative approaches to peace and security, focusing from bottom-up on an engendered peace with sustainability, may help society and the environment to be managed in the highly fragile natural conditions of a 'hothouse Earth'. Thus, the book explores systemic alternatives based on indigenous wisdom, gift economy and the economy of solidarity, in which an alternative cosmovision fosters mutual care between humankind and nature. • Special analysis of risks to the survival of humankind in the 21st century. • Interdisciplinary studies on peace, security, gender and environment related to global environmental and climate change. • Critical reflections on gender relations, peace, security, migration and the environment • Systematic analysis of food, water, health, energy security and its nexus. • Alternative proposals from the Global South with indigenous wisdom for saving Mother Earth. This book is a comprehensive account of all significant energy sources, evaluated according to their capacity, reliability, cost, safety and effects on the environment. Non-renewable sources (for example, coal, oil, gas and nuclear fuel) together with renewable sources like wood, hydro, biomass, wind, solar, geothermal, ocean thermal, and tidal; are considered. Also, nuclear radiations and the disposal of nuclear waste and the future of nuclear power are assessed, as well as pollution and acid rain, the greenhouse effects and climate change. Its social, political and moral problems are discussed, with a special mention of the opposition to nuclear power. As the seriousness of climate change becomes more and more obvious, military institutions are responding by taking a prominent role in the governing of environmental concerns, engaging in "climate change war games," and preparing for the effects of climate change—from conflicts due to loss of food, water, and energy to the mass migration of millions of people displaced by rising sea levels. This combat-oriented stance stems from a self-destructive pattern of thought that Robert P. Marzec names "environmentality," an attitude that has been affecting human-environmental relations since the seventeenth century. *Militarizing the Environment* traces the rise of this influential mindset in America and other nations that threatens to supplant ideas of sustainability with demands for adaptation. In this extensive historical study of scientific, military, political, and economic formations across five centuries, Marzec reveals how environmentality has been instrumental in the development of today's security society—informing the creation of the military-industrial complex during World War II and the National Security Act that established the CIA during the Cold War. Now embedded in contemporary Western thought, environmentality has even infiltrated scientific thinking—transforming Darwinian insights into a quasi-theology that makes security the

biological basis of existence. Marzec exposes the self-destructive nature of this increasingly accepted worldview and offers alternatives that counter the blind alleys of national and global security. *Holocene Climate Change and Environment* presents detailed, diverse case studies from a range of environmental and geological regions on the Indian subcontinent which occupies the central part of the monsoon domain. This book examines Holocene events at different time intervals based on a new, high-resolution, multi-proxy records (pollen, spores, NPP, diatoms, grain size characteristics, total organic carbon, carbon/nitrogen ratio, stable isotopes) and other physical tools from all regions of India. It also covers new facilities in chronological study and luminescence dating, which have added a new dimension toward understanding the Holocene glacial retreats evolution of coastal landforms, landscape dynamics and human evolution. Each chapter is presented with a unified structure for ease of access and application, including an introduction, geographic details, field work and sampling techniques, methods, results and discussion. This detailed examination of such an important region provides key insights in climate modeling and global prediction systems. Provides data and research from environmentally and geologically diverse regions across the Indian subcontinent Presents an integrated and interdisciplinary approach, including considerations of human impacts Features detailed case studies that include methods and data, allowing for applications related to research and global modeling This textbook provides an overview of the major environmental policy issues, past and present, and explains the interplay among law, science, and advocacy as related to environmental policymaking in the United States and abroad. *Environmental Policy and Public Health* examines the main sources of pollution and threats to environmental integrity and explores the consequences of pollution on the environment and the population. Throughout the book, noted environmental policy expert William N. Rom explains the legal basis for environmental action, beginning with the Clean Air Act, the Wilderness Act, the National Environmental Policy Act, the Endangered Species Act, and international treaties. In addition to providing information about existing laws, the author presents potential policy alternatives that offer real-world solutions. Comprehensive in scope, the book incorporates developments in law, economics, global warming, and air pollution. *Environmental Policy and Public Health* covers these topics and also puts an emphasis on wilderness protection. An important focus of the book is an assessment of the role of policy analysis in the formation and implementation of national and local environmental policy.
