*Anthropogenic greenhouse gas emissions, energy security and sustainability are three of the greatest contemporary global challenges today. This year the Sino-German Cooperation Group "Underground Storage of CO<sub>2</sub> and Energy", is meeting on the 21-23 May 2013 for the second time in Goslar, Germany, to convene its 3rd Sino-German conference on the theme "Clean Energy Systems in the Subsurface: Production, Storage and Conversion". This volume is a collection of diverse quality scientific works from different perspectives elucidating on the current developments in CO<sub>2</sub> geologic sequestration research to reduce greenhouse emissions including measures to monitor surface leakage, groundwater quality and the integrity of caprock, while ensuring a sufficient supply of clean energy. The contributions herein have been structured into 6 major thematic research themes: Integrated Energy and Environmental Utilization of Geo-reservoirs: Law, Risk Management & Monitoring CO<sub>2</sub> for Enhanced Gas and Oil Recovery, Coal Bedded Methane and Geothermal Systems Trapping Mechanisms and Multi-Barrier Sealing Systems for Long-Term CO<sub>2</sub> Storage Coupled THMC-Processes and Numerical Modelling Rock Mechanical Behaviour Considering Cyclic Loading, Dilatancy, Damage, Self-sealing and Healing Underground Storage and Supply of Energy "Clean energy systems in the subsurface" will be invaluable to researchers, scientists and experts in both academia and industry trying to find a long lasting solution to the problems of global climate change, energy security and sustainability.*

*Enhanced Geothermal Systems (EGS) with CO<sub>2</sub> as Heat Transmission Fluid--A Scheme for Combining Recovery of Renewable Energy with Geologic Storage of CO<sub>2</sub>* Mar 30 2023 *It has been suggested that enhanced geothermal systems (EGS) may be operated with supercritical CO<sub>2</sub> instead of water as heat transmission fluid (D. W. Brown, 2000). Such a scheme could combine recovery of geothermal energy with simultaneous geologic storage of CO<sub>2</sub>, a greenhouse gas. At geothermal temperature and pressure conditions of interest, the flow and heat transfer behavior of CO<sub>2</sub> would be considerably different from water, and chemical interactions between CO<sub>2</sub> and reservoir rocks would also be quite different from aqueous fluids. This paper summarizes our research to date into fluid flow and heat transfer aspects of operating EGS with CO<sub>2</sub>. (Chemical aspects of EGS with CO<sub>2</sub> are discussed in a companion paper; Xu and Pruess, 2010.) Our modeling studies indicate that CO<sub>2</sub> would achieve heat extraction at larger rates than aqueous fluids. The development of an EGS-CO<sub>2</sub> reservoir would require replacement of the pore water by CO<sub>2</sub> through persistent injection. We find that in a*

*fractured reservoir, CO2 breakthrough at production wells would occur rapidly, within a few weeks of starting CO2 injection. Subsequently a two-phase water-CO2 mixture would be produced for a few years, followed by production of a single phase of supercritical CO2. Even after single-phase production conditions are reached, significant dissolved water concentrations will persist in the CO2 stream for many years. The presence of dissolved water in the production stream has negligible impact on mass flow and heat transfer rates.*
