This chapter reviews different aspects of food production facility cleaning and sanitizing programs, and chemical and non-chemical systems used for cleaning and sanitizing. It offers practical advice on many aspects of cleaning and, where possible, shows how to clean in the traditional way, the time-saving way and the green way. Compensatory education for alienated students at risk of dropping out is a recognized part of the educational landscape. This is the first ethnographic study of such a program. It focuses on students and staff at two state-supported sites--one composed of white students, the other being predominantly African American. Participants are paid to attend, and are given academic remediation, counseling, and job assignments in the community. The author found that, unknown to the staff or the state, the program is unsuccessful in its main goal of reintegrating adolescents into their schools. He associates this failure with the program's perception of its students, the trivial curriculum, and the lack of student involvement in planning. ^L ^L Coming from the perspective of critical theory, the author challenges the mainstream view that this program compensates for deficiencies that individual students bring with them to the classroom. His findings support the idea that the program legitimates stratification by giving potentially disruptive students mixed messages. Operating from an ideology of hope, the program tells students that they should challenge themselves to aspire to become middle class professionals. At the same time, however, it

ignores institutional barriers and fails to give its students the tools they need to succeed in school. This study has implications for all educators attempting to reach at-risk youth. Many researchers jump straight from data collection to data analysis without realizing how analyses and hypothesis tests can go profoundly wrong without clean data. This book provides a clear, step-by-step process of examining and cleaning data in order to decrease error rates and increase both the power and replicability of results. Jason W. Osborne, author of Best Practices in Quantitative Methods (SAGE, 2008) provides easily-implemented suggestions that are research-based and will motivate change in practice by empirically demonstrating, for each topic, the benefits of following best practices and the potential consequences of not following these guidelines. If your goal is to do the best research you can do, draw conclusions that are most likely to be accurate representations of the population(s) you wish to speak about, and report results that are most likely to be replicated by other researchers, then this basic guidebook will be indispensable.
