2021 Essentials of Craniomaxillofacial Trauma is destined to become a favorite with all students of plastic surgery, otolaryngology, and maxillofacial surgery, whether residents in training or experienced practitioners. Small enough to fit in a lab coat pocket but comprehensive enough to cover the essential topics in facial trauma, this exceptional manual is just the resource you need. It will prove invaluable as a quick reference on the "front lines" in the emergency room as well as for use in daily practice, when studying for board exams, or simply as a refresher when confronting a difficult clinical problem. This book evolved from the outstanding craniomaxillofacial trauma programs at Duke University and Johns Hopkins University/Maryland Shock Trauma Unit and is built on the principles and treatment protocols employed

at these institutions. Contributors are senior surgeons who are paired with current residents or fellows from these programs. They share their practical, hands-on experience. Packed with Critical Information This practical manual provides essential information in a convenient, fully illustrated, and easily accessible outline format. It focuses on the most common problems in facial trauma and then provides the critical information needed for immediate bedside care. Divided into 21 chapters, this handbook is organized into two main sections. Part I focuses on basic principles for managing facial trauma, whereas Part II concerns regional management and contains chapters on injuries to specific anatomic regions. Each chapter within this second section follows a consistent format that includes anatomy, fracture patterns, surgical indications, operative sequence, postoperative care, complications, and recommended follow-up. Tips are highlighted throughout, and a bulleted list of pearls concludes each chapter. References at the end of each chapter direct the reader to additional resource material. Easily Accessible Format This handbook's design and format make it readily accessible, highly readable, and ideal for quickly locating important information. Bulleted lists, tables, and boxes as well

as tips and pearls illuminate key points featured throughout. Pediatric Oral and Maxillofacial Trauma Aug 15 2021 Maxillofacial trauma refers to any injury to the face or jaw caused by physical force, the presence of foreign objects, animal or human bites, or burns. Our fast paced world of ultra sports and increasing violence puts children at risk for facial injury. In childhood, a generally impetuous nature and adventurous spirit combine to encourage participation in physical activities with a little thought for the immediate consequences. But, children's facial injuries require special attention, because not only the tissues, bone or teeth may be involved, but also the child's entire self-image. Treatment modalities in children as compared to adults are somewhat different owing to the needs of the growing facial skeleton. First, the pediatric patient has the advantage of an accelerated ability

to heal. Second, through growth and inherent ability of the child to adapt, recovery of damaged oro-facial tissues can be maximized and loss of function can be minimized. Despite these advantages, certain characteristics of the pediatric facial trauma such as difficulty to examine the child both clinically and radiologically, growth process and elasticity of bone and anatomy of the immature face.

Etiology & Injury Characteristics in Maxillofacial Trauma Dec 07 2020 This was a retrospective study carried out to determine the incidence, etiology, injury characteristics of maxillofacial injuries reported at our centre. The data for this study were obtained from the medical records of 689 cases reported to our centre during the period from 2006-2009. Records of patients who were either treated in the emergency room as outpatients or in the Department of Oral and Maxillofacial Surgery as inpatients were analyzed and were subjected to statistical analysis using statistical package for social sciences (SPSS) for Windows version 17.0. Data was summarized in form of proportions and frequency tables for categorical variables and was

subjected to Chi-Square test. Out of 689 patients, 75.9% were male and 24.1% were female. 42.5% of the patients were in the age group of 21 to 30 years. Road traffic accidents accounted for the majority (74.3%) of cases of maxillofacial trauma. Mandible was seen as the most commonly fractured bone (50.3%) and 53.8% head and neck injuries were most common among the associated injuries. Road traffic accidents were clearly the most prevalent etiological factor for maxillofacial trauma.

Atlas of Craniomaxillofacial Trauma Mar 10 2021 This is a full-colour illustrative textbook written by highly experienced consultants from two different continents ? Asia and Europe ? which sets out to

compare the two possibly dissimilar scenarios of maxillofacial trauma in relation to the epidemiology and aetiology of the two regions. All cases presented in this atlas are from the authors' personal experience during their day-to-day management of patients. The surgical procedure is explained in a step-by-step manner which allows for better understanding, particularly by students who have not had the opportunity to observe the procedures in clinics and operating theatres. Pediatric Maxillofacial Trauma Oct 29 2022 This book aims to assist the reader in navigating the potentially complex decision-making process involved in selecting the most appropriate intervention for each particular scenario that may be encountered by the practitioner or surgeon in the growing patient with facial trauma. Among the topics covered are the initial management of both soft and bony trauma, including different types of fracture, as well as the management of complications and revision surgery. The discerning practitioner will learn how to provide the appropriate intervention at the appropriate time, by taking into account skeletal growth when matching techniques to the injuries more common in the skeletally immature patient. It is also emphasized that in some cases, no intervention is advisable owing to the possibility of damaging growth centers or introducing additional scar tissue that may impede future growth. Pediatric Maxillofacial

Trauma will provide key knowledge for surgeons treating growing patients, ensuring that their decisions to operate or delay intervention are evidence based.
